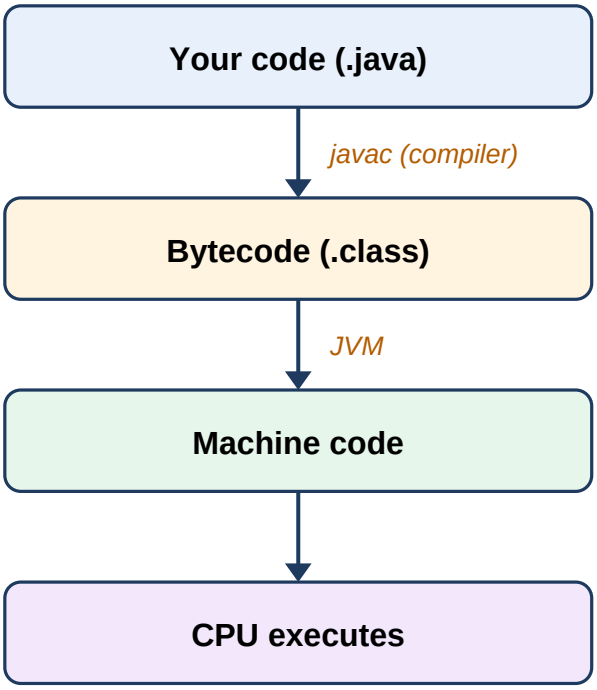
Java Notes

Accenture Java Bootcamp preparation

1. How Java Code Runs



2. Source Files and the .java Extension

• Source code is a **plain text** file. The editor (VS Code, Notepad) is only the tool you write it with.
• The file must end with **.java**. `javac` only accepts .java files; a .txt file is not treated as Java code, and VS Code will not highlight or run it.
• The file name must match the **public class** name:

`public class GFG { ... }` → file must be `GFG.java`

Otherwise: `class GFG is public, should be declared in a file named GFG.java`

• Class names use **PascalCase**: `Main, BankAccount, FizzBuzz`.

3. Calling Methods

• When Java sees a method call, it **first looks inside the class it is in**. It does not search other classes on its own.
• Method in the **same class** → call it directly: `anothermessage()`
• Static method in **another class** → give the address: `ClassName.methodName()`
  Example: `Anothermessage.anothermessage()`
• Why? Two classes can have methods with the **same name**; the class name removes the confusion.
• The `()` is required and stays attached to the method name. Without it, Java reads the name as a variable.
• The type before the name is the **return type**: `static String hello()` returns a String; `void` returns nothing.
• `return` sends the value back to **where the method was called**.
